

One-Step Connection Using Public Key and Passthrough

This method requires that you first set up [public key authentication](#) and [SSH passthrough](#). Once those steps are completed, you can connect from your local system to a system inside the NAS enclave with one single use of SSH, as follows:

```
your_local_system% ssh your_username@nas_hostname
```

where *your_username* is your NAS username, and *nas_hostname* is one of the hosts you listed in your `~/.ssh/config` fileâ for example, `pfe[20-27]` or `lfe[5-8]`.

Note: If you have the same username for your local system and the NAS systems, you can omit "*your_username@*" from the command line.

Example:

```
your_local_system% ssh pfe21  
Enter PASSCODE: type in your passcode  
pfe21%
```
